

ABSTRACT:

A pivoting lever which is part of a connector plug used to connect an electrical cord to a jack of a telephone, computer, other electrical device or other terminal housing. The pivoting lever is part of the mechanism used to lock the plug to a jack of electronic devices or other terminal housings. Compression of the pivoting lever against a matter of opposing force allows the lever to return to its original state thereby allowing the locking of the connector plug to a jack cavity of an electronic device as well as providing for the connector plug's release from an electronic device or terminal housing when the lever is compressed.
